                                                                                                                                                                                                                                                                                                                                                                                                                    Details of S. pombe sequencing at the Sanger Institute are available on the World Wide Web.

(URL, http://www.senger.ac.uk/Projects/S pombe/index.jsp) (URL,

tttp://www.sanger.ac.uk/Projects/S pombe/)

CDS are numbered using the following system eg·SPAC5H10.01c. SP (S. pombe), A (Girnomosome 1), CSH10 (cosmid name), 01 (first CDS), c

(complementary strand). However, clones may have been reorientated since the original submission, therefore the complementary strand notation may be invalid for strand inference. IMPORTANT: This sequence MAX NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once. Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NQLVFQLSIPLNFLGSVYREMRQAFTDMEQLFSLKRINIQVKEAPDARDLVLKGGSIQ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  52854
                                                                                                  * NOTE: This record contains 158 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* defaultying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of 765 bp in length 100 bp in length 100 bp in length f 100 bp in length d of 765 bp in length

Oryza sativa chromosome 12 sequencing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The following sequence is oriented from the T7 to the SP6 end. The nucleotide sequence of this BAC clone was generated by combining Monsanto. Syngerta and Genoscope sequencing data.

Upstream BAC (overlapping the T7 end): OSJNBa0018E22 (AC=AL845346)

Downstream BAC (overlapping the SP6 end): OSJNBa00136A19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Direct Submission

Giordano J; Duclert A, Dumas Milne Edwards J,

WPI; 2000-500381/45. P-PSDB; AAG03158.

New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.

Claim 1; SEQ ID NO 3162; 71pp + Sequence Listing; English

The present sequence is one of a large number of 5' ESTs derived from manAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTF) of the mRNA because they are often obtained from oligo-dT primed obNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length

                                                                                                                                   셤
                                                                                                                                                                                                                     This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert genomic cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon of oligonicleotides and/or peptides. The determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations of side in ceptide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously, ABD13410-ABD14212 represent genomic DNA sequences used to illustrate the method for for determining the degree of cytosine methylation in the
                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (G) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridisation to both classes, each with at least one member, of oligomelectides and/or peptide-nucleic acid (BNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of cligomers, the degree of methylation is calculated. The method is used:

(1) for diagnosis and/or prognosis of side effects of the central errous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-2012 represent genomic DNA sequences used to illustrate the method
                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for determining the degree of cytosine methylation described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, cytosine methylation, 5'-CpG-3', uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-Cpd-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (0) but not methylated c, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of cligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of the central or wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastroinesstinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously. Abgl3410-Abg34121 represent genomic DNA sequences used to illustrate the method in the for the formal of the degree of cytosine methylation described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                              Human; cytosine methylation; 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-OpG-3', present in a genomic sample of DNA. The sample is treated Chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the chemical contains the degree of thybridised to the classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations of single flower playmorphisms (SNP's); and (ii) for differentiation. The method allows the methylation investigating cell differentiation. The method allows the methylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful for

This invention describes isolated or purified polynucleotides

corresponding to human gene trapped sequence (GTS) comprising a sense or

contisones sequence chosen from 1000 sequences or its fragment of 8

contisones mucleotides. GTSs are useful for gene discovery and as markers

contisones mucleotides. GTSs are useful for gene discovery and as markers

contisones mucleotides. GTSs are useful for gene discovery and as markers

cross species hybridisation analysis, genetic manipulation, antisense

thibition, gene targeting, identification or generation of full-length

cross species hybridisation analysis, genetic manipulation, antisense

thibition, gene targeting, identification or generation of full-length

cross species hybridisation probe or for chromosome mapping,

and determining the genetic basis of human disease. Portion of the GTS

sequences are useful as a hybridisation probe or for chromosome mapping,

and can be incorporated into phage display system that can be useful

cross or other ligands, that are capable of hinding an

anino acid sequence encoded by the GTS sequences. The GTS sequences are

creen for proteins, or other ligands, that are capable of hinding an

anino acid sequence expression, as a part of riboxyme and/or

triple helix sequences that can be used to requlate gene expression, as

compenital reats or defects. The polymuclectides of the invention are

compenital traits or defects. The polymuclectides of the invention are

compenital to disgnosis, prognosis of disorders involving developments of

polymorphisms, and also as genetic markers for prenatal analysis of

congenital to selected systems. The polymuclectides of the invention are

congenital to selected systems, polymuclectides of normal analysis of

congenital to selected with the expression of marten to normal, variants of GTSs

include, aging, cancer, autorimmum disease, Crohn's disease, multiple

cof the neural or skeletal systems, Alleiner's diseases, menume of

cof the neural or skeletal systems, Alleiner's diseases, and can
                                                                                                                                                                                                                                                                                                                        Novel human polynucleotides that correspond to human gene trapped sequences useful for gene discovery, gene therapy, as markers for gene expression analysis, forensic analysis and determining genetic basis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAQ28603 and AAQ28610-14 encode signal peptides which were used to allow the secretion of a toxin from the cells in which they were produced. The toxin used was an insect specific scorpion toxin from Buthus eupeus and it was expressed under the control of a baculovirus promoter in a recombinant A. california Nuclear polyhedrosis virus (AcMNPV). Baculoviruses are host selective and can be used for insecticides as they are non-polluting to the environment. Sultable signal sequences for the secretion of the toxin into the insect host may be derived from mammalian or insect cells. These signal peptides are cleaved from the toxin so that the toxin can be secreted. The signal peptides can therefore be fused to either the N-terminal or C-terminal amino acid residue of the toxin either directly or via a linker sequence. The invention relates to a polynucleotide having any of 6006 specific sequences (ABZ50888-ABZ56893), which are expressed by a fungus under specific culture conditions including one or more of europhic, oligid early germination, alkaline, high temperature, low temperature or maltose culture or polynucleotides stringently hybridising progress of fermentation and the growth conditions of a fungus, especially of Aspergillus oryzae which is widely used in industrial fermentation. Also monitoring for fungal contamination. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
Detection of expression of specific Aspergillus genes for monitoring the fermentation and growth conditions of the fungus, using DNA probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genchic sample of DNA. The sample is treated chemically to convert genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated (C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonuclectides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP, b); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ121 represent genomic DNA sequences used to illustrate the method for disclosure of the invention
                                                                                                                                                               Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.

```
This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-0pd-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic convert methylated to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes, each with at least one member, of oligoner. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (NDF's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ34121 represent genomic DNA sequences used to illustrate the method for the contraction of cell or described in the invention
                                                                                     Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, cytosine methylation, 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.

status of many C residues to be determined simultaneously. ABQ13410-ABQ94121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention

Sequence 524 BP; 184 A; 187 C; 54 G; 99 T; 0 U; 0 Other;

```
This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligomorbotides and/or peptide-nucleic acid (PNA) oligomers and the charge of hybridised to two classes; each with at least one member, of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations of single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation
Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc. particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation station of many C residues to be determined simultaneously. ABO13410-

RESULT 15

Human, cytosine methylation; 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds. Oligonucleotide for detecting cytosine methylation SEQ ID NO 14383. 

Guetig D;

Berlin K,

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.

Claim 12; 56pp + Sequence Listing; 56pp; German.

This invention describes a novel method for determining the degree of

methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert.

Genomic sample of DNA. The sample is treated chemically to convert.

CC DNA that contains the target C is amplified to form a labeled amplicon.

The amplicon is hybridised to two classes, each with at least one member, of oligomucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of clasmers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP, s); and (ii) for differentiation of call or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ1310-ABQ121 represent genomic DNA sequences used to illustrate the method for disclosure of the invention

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 1

Patent No. 6551795

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: MATC 0. Whenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AREGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AREGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APLICATION NUMBER: US 60/074,788

PRIOR FILING DATE: 1998-02-18

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR SEQ ID NOS: 33142

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 697, Application US/09543681A

Patent No. 6605709

GENERAL INFORMATION:
APPLICANT: GARY ERETON

TITLE OF INVENTION: UNCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABIL
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.1002-001

CURRENT APPLICATION NUMBER: US/09/543,681A

CURRENT PILING DATE: 2000-04-05

PRIOR APPLICATION NUMBER: US 60/128,706

PRIOR APPLICATION NUMBER: US 60/128,706

PRIOR SEQ ID NOS: 8344

SEQ ID NO 697

LENGTH: 1740
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 15
US-08-436-080-1/c
i Sequence 1, Application US/08436080
i Patent No. 5834292
i GENERAL INFORMATION:
APPLICANT: Randerson, David M.
ITLE OF INVENTION: Method for Producing Somaclonal Variant
ITLE OF INVENTION: Cotton Plants
NUMBER OF SEQUENCES:
ADDRESSE: Christie, Parker & Hale
STREET: P.O. Box 7068
CITY: Pasadena
STREET: Christie, Parker & Hale
COMPUTER: READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
PAPLICATION NUMBER: US/08/436,080
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match 75.8%; Score 14.4; DB 1; Length 4360; Best Local Similarity 93.8%; Pred. No. 2.4e+02; Matches 15; Conservative 0; Mismatches 1; Indels 0
                                                  PPPLICATION NUMBER: US 07/122,200
FILING DATE: 18-NOV-1987

APPLICATION NUMBER: US 07/680,048
FILING DATE: 29-MAR-1991
ATTONEEY/AGENT INFORMATION:
NAME: Sharp Esq., Janice A.
REGISTRATION NUMBER: 34,051
REPERENCE/DOKERT NUMBER: P14:25601
TELEPHONE: (818)795-5843
TELEPHONE: (818)795-5843
TELEPHONE: (818)795-5843
TELEPHONE: (818)77-176
SEQUENCE CHARACTERISTICS:
LENGTH: 4360 Dase pairs
TYPE: nucleic acid
STRANDEDNESS: double
TYPE: Innear
MOLECULE TYPE: NO
ANTI-SENSE: NO
ORIGINAL SOURCE:
CORGANISM: Bacillus thuringiensis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CLASSIFICATION: 435

/note="Vector: pCS107; Site_1: EcoRI; Site_2: NotI; cI
was oligo dT primed from Sug of poly A+ RNA from egg.
EcoRI-NotI cut cDNA was then ligated into pCS107 with
EcoRI at the 5' end and NotI at the 3' end"
